Plan for Chiropractic School Riles Florida Faculty

Faculty members are questioning a proposal to make Florida State University (FSU) in Tallahassee the first public U.S. university with a chiropractic medicine school. This week the faculty’s graduate policy committee voted to examine the proposal amid concerns that implementing it would undermine the university’s reputation. But FSU administrators say such a graduate program, if ultimately adopted, would be a valuable addition to health care education and could benefit millions of Americans who suffer from back pain.

“There’s a very good reason why no public university offers a degree in chiropractic medicine,” says Raymond Bellamy, director of orthopedic surgery at FSU’s Pensacola campus and leader of the opposition campaign. “It’s because having a chiropractic program would seriously undermine the scientific tradition of any institution.” Not so, says FSU provost Larry Abele, an invertebrate morphologist: “A graduate education and research program aimed at moving chiropractic medicine into a scientific and evidence-based realm is certainly worth exploring.” The flap is reminiscent of a dispute at York University in Toronto, Canada, when faculty members blocked a plan to offer an undergraduate degree program that would have been affiliated with the Canadian Memorial Chiropractic College (Science, 19 February 1999, p. 1099).

Last March, at the urging of a state senator who’s also a chiropractor, the Florida legislature authorized $9 million per year to establish such a school. FSU administrators conducted a feasibility study and drew up a proposal for a College of Complementary and Integrative Health that would offer a 5-year Doctor of Chiropractic degree. That proposal, which cited studies that it claimed showed “why more than 15 million Americans use chiropractic care,” was to be presented this week to the university’s board of trustees and 2 weeks later to the state Board of Governors.

Abele says chiropractic medicine is a legitimate field of study that deserves a place in the academic mainstream. He also says the university will not implement the proposal unless it has the support of the faculty: “The legislation simply authorizes funds for setting up the school. It does not require that we do so.” Even so, FSU officials advertised in November for the position of dean of the proposed school.

Richard Nahin, a senior adviser at the National Center for Complementary and Alternative Medicine at the National Institutes of Health, says the popularity of chiropractic care among Americans makes it important to understand whether “chiropractic works, what conditions it may work for, and how it may work. Having a state chiropractic school could be of benefit to the field,” he adds, “as that school would probably educate chiropractors using the same scientific, evidence-based approach used to train medical doctors.”

None of those arguments is enough to convince neuroscientist Marc Freeman, one of 40 FSU professors—including Nobel Prize-winning chemist Harry Kroto and physicist J. Robert Schrieffer—who have signed a petition against the proposal. Apart from the lack of a scientific basis, he says, the chiropractic school is a threat to FSU’s academic independence. “We cannot have the legislature forcing a program on a public university,” he says.

DEVELOPMENTAL BIOLOGY

Bird Wings Really Are Like Dinosaurs’ Hands

Molecular studies have smoothed a wrinkle in the assumption that modern birds had dinosaur ancestors. After tracing the expression of two genes important in the development of digits in wings and other limbs, researchers have concluded that the three digits in bird wings correspond to the three digits in dinosaurs’ forelimbs. For years, most embryologists had considered them different. “This may settle a long-standing controversy and will strengthen the theropod [dinosaur]—bird link,” says Sankar Chatterjee, a paleontologist at the Museum of Texas Tech University in Lubbock.

Over the past decade, new fossils and phylogenetic analyses have convinced most paleontologists that birds are dinosaurs. A few researchers have refused to accept this evolutionary pathway, and one tenet of their argument has to do with how to count fingers.

Terrestrial vertebrates typically have five fingers, numbered 1 to 5. In both dinosaur fossils and birds, just three of these digits are fully developed, a trait that at first glance supports a dinosaur-bird connection. But dinosaur forelimbs have the first three digits, with stubs for the last two. In contrast, going by some embryological evidence, birds appear to have retained the middle three fingers. In 1997, for example, ornithologist Alan Feduccia, a noted critic of the bird-dinosaur link at the University of North Carolina, Chapel Hill, and a colleague tracked digit...
Controversy over California’s new stem cell initiative didn’t end when the state’s voters approved Proposition 71 in November by 59% to 41%. But now that the new California Institute for Regenerative Medicine (CIRM) is beginning to take shape, the debate has shifted from ethics and costs to how the enterprise will operate. Supporters are still brimming with confidence, however.

The new institute as yet has no staff, no home, and just a one-page Web site (www.cirm.ca.gov). But at a press conference last week, Robert Klein, CIRM’s newly elected chair of the board, repeated assurances that he expects grants to start flowing by May. “I admit that I am an optimist,” he added.

At its first full meeting, held on 6 January at the University of Southern California in Los Angeles, the 29-member board, called the Independent Citizen’s Oversight Committee (ICOC), set up subcommittees to find outsiders for “working groups” that will establish policies on research funding, ethics, and facilities construction. They also launched the hunt for a president for CIRM—ideally a seasoned biomedical or real estate enterprise “reasonably likely to benefit” from the stem cell program. He plans to step down after serving 3 years of his 6-year term. And he has resigned as head of the California Research and Cures Coalition (CRCC), which has been reconstituted as a nonprofit education and lobby group. CRCC hopes to build confidence with four community forums to be held around the state this month, at which citizens will discuss “practical and ethical issues” with scientists.

For now, at least, supporters seem to out weigh critics. “I think [the organizers of the CIRM] are drawing in the best this country has to offer,” says Michael Manguenio of the Christopher Reeve Paralysis Foundation. Some scientists have expressed skepticism about the wisdom of funding research by means of popular vote and worry that the public has been oversold on the promises of the research. But it’s hard to find a critic among stem cell researchers, who stand to benefit from the $3 billion and the new wave of attention that CIRM will bring to their field.

Penhoet is heading the search for space for the institute’s administrative headquarters. Also on the front burner is securing a start-up loan of $3 million from the state.

The critics have been busy as well. A primary concern, voiced by the Center for Genetics and Society in Oakland, among others, is that the initiative—which is immune from legislative tampering for the first 3 years—has been framed so that it may freely violate state and federal regulations on matters such as open meetings and conflicts of interest. Critics also worry that taxpayers won’t get proper returns from patent and royalty fees, and some are troubled that Klein designed the entire initiative and slid into the top job without a hint of competition.

But supporters seem to have limitless confidence in 59-year-old Klein, who put more than $3 million of his own money into the Proposition 71 campaign and helped raise more than $20 million. A graduate of Stanford law school and president of Klein Financial Corp. in Fresno, California, which finances the construction of low-cost housing, Klein was drawn into the stem cell issue because his 14-year-old son Jordan has juvenile diabetes.

Committee members say they can negotiate the ethical minefield. “Whatever connections we might have anywhere” have to be a matter of public record, notes Holmes. Klein has pledged not to hold investments in biomedical or real estate enterprises “reasonably likely to benefit” from the stem cell program. He plans to step down after serving 3 years of his 6-year term. And he has resigned as head of the California Research and Cures Coalition (CRCC), which has been reconstituted as a nonprofit education and lobby group. CRCC hopes to build confidence with four community forums to be held around the state this month, at which citizens will discuss “practical and ethical issues” with scientists.

For now, at least, supporters seem to outweigh critics. “I think [the organizers of the CIRM] are drawing in the best this country has to offer,” says Michael Manguenio of the Christopher Reeve Paralysis Foundation. Some scientists have expressed skepticism about the wisdom of funding research by means of popular vote and worry that the public has been oversold on the promises of the research. But it’s hard to find a critic among stem cell researchers, who stand to benefit from the $3 billion and the new wave of attention that CIRM will bring to their field.
